SUBJECT:

TRANSFER DECALS

MODELS:

ALL

Adequate adhesion of transfer decals on various Triumph models will not be achieved unless the panels are cleaned and the transfer applied to a panel which has been normalized at a temperature of 60°F. minimum.

All dealers are reminded that it is necessary for the vehicle body panel to attain the above temperature before application of the decals, and this may be achieved by allowing a vehicle to remain in normal workshop temperature for at least one hour prior to application. This requirement is particularly important during winter months.
